- **Readiness For Commercial Launch & Next Steps**

As we move with time, the agility and experience expectations are increasing at must faster pace and so to achieve this on hybrid network there is a need to uplift in physical network too.

Catalyst demonstrates how recent modelling standards and automation concepts developed for Virtual networks could be adopted to accelerate Plan & Build of Physical Network

Project Champion:

Problem statement: current cumbersome PNF plan & build process with –

- multiple handoffs
- non-standardization
- lack of automation

slowing down product launch over hybrid network

Vision: Build Next Generation Plan and Build (NG P&B) solution demonstrating power of NetOps to significantly reduce PNF onboarding time.

Catalyst Lead

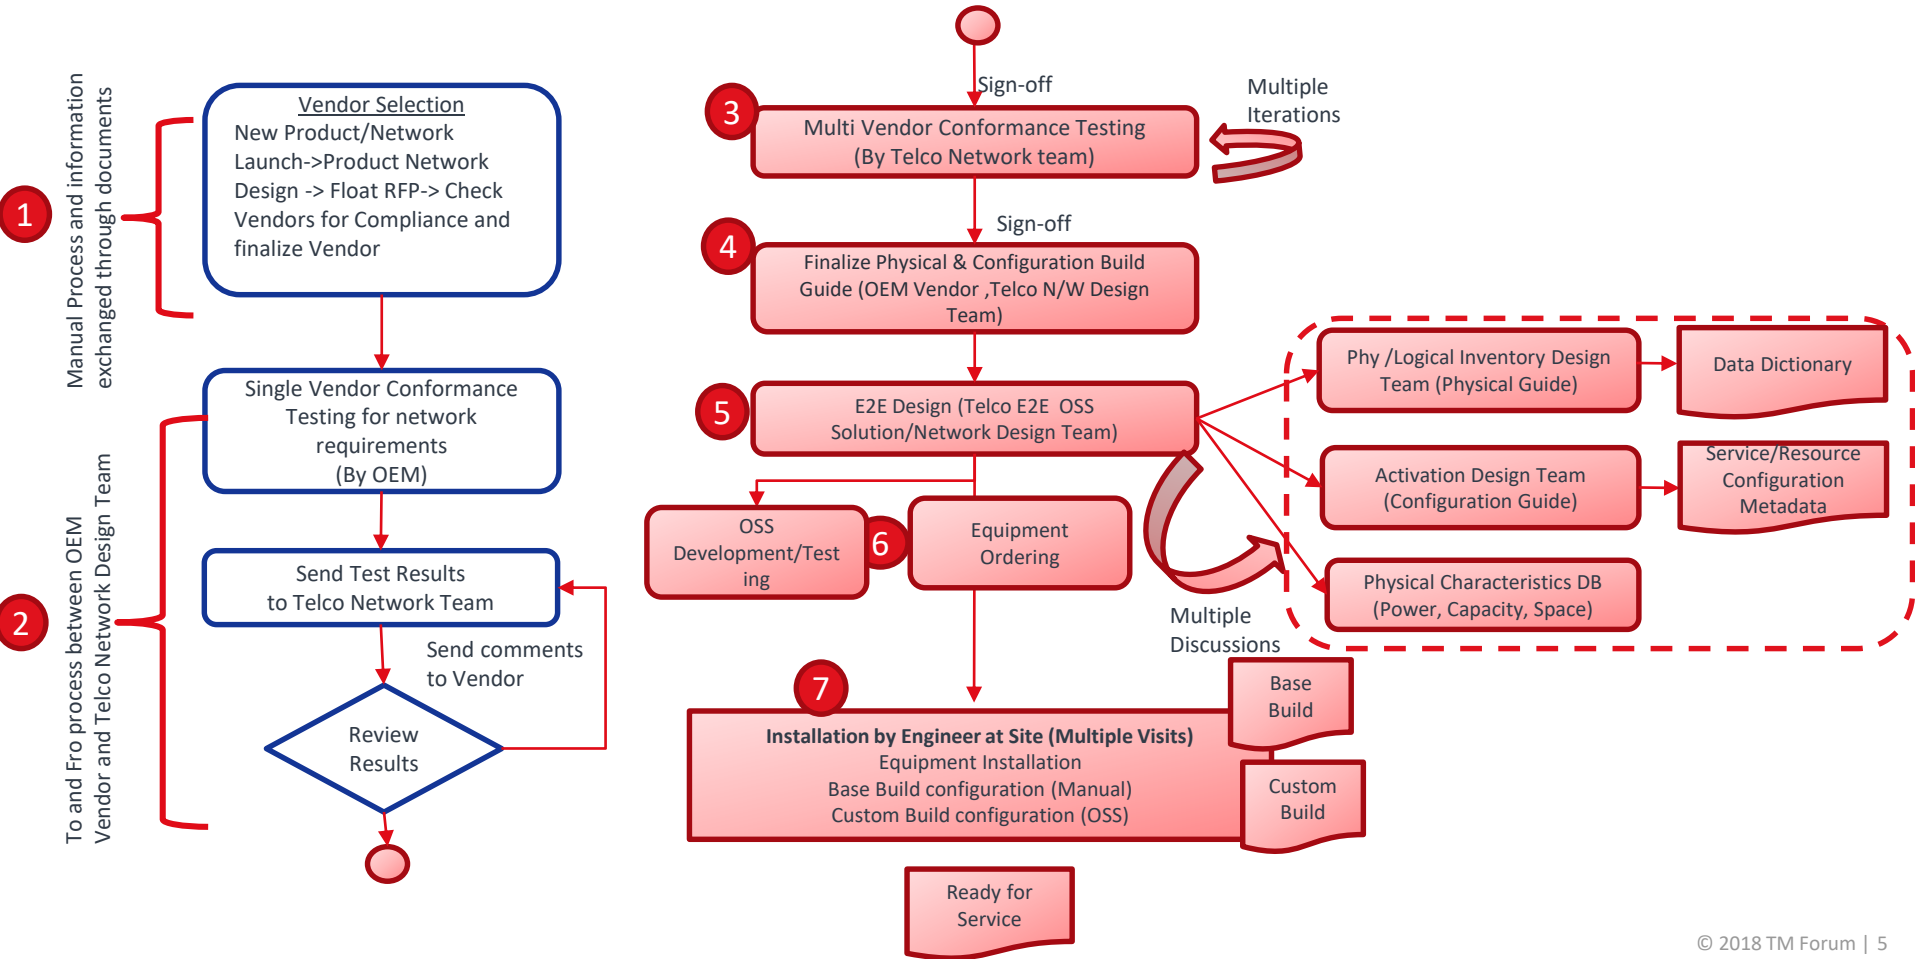

Contribution: Building NG P&B platform leveraging standards like YANG to speed up PNF onboarding.

Participant

Contribution : Consume YANG to model PNF and support life cycle management

Typical PNF Onboarding Approach Today...

...and this is how it impacts Business Agility

New Equipment launch process...

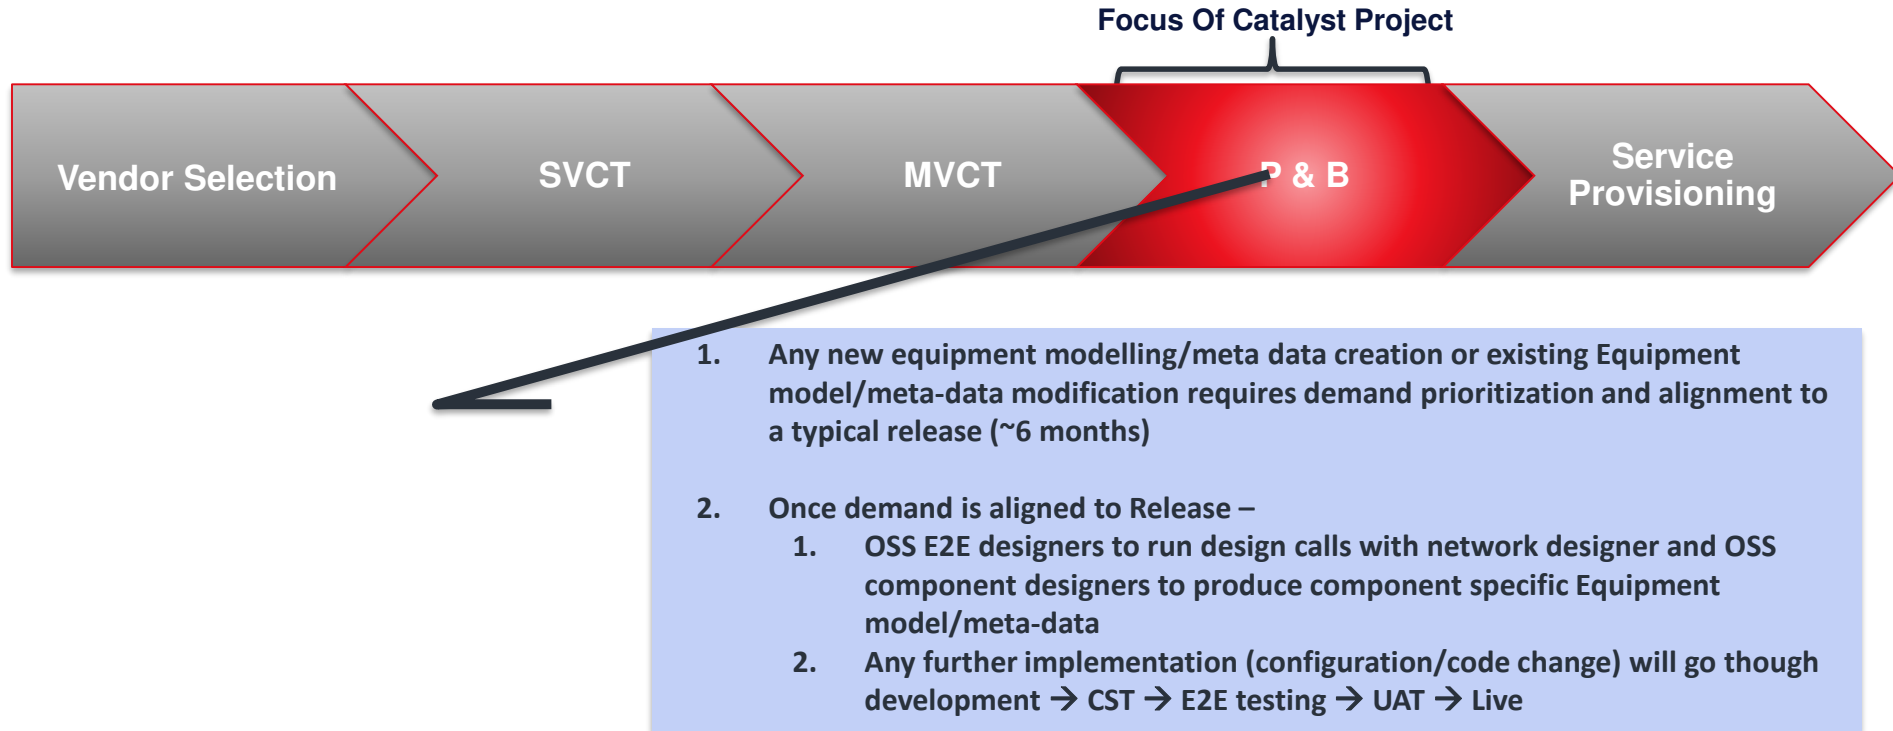

Equipment upgrade (addition of new card etc.) process...

*Total 6-8 months of Plan & build depends on **complexity**, OSS team's **capacity**, **business priority** and **release cycle** when request is submitted by Business.

SVCT – Signer Vendor Conformance Testing
MVCT – Multi Vendor Conformance Testing

Unlike VNF which can be spun in real-time, dedicated P&B for physical network is major bottleneck for speedy product launch around hybrid network.

Why Current P&B is time consuming?

P & B

**Different teams and
roles**

**Different formats
used via components
for device modelling**

**Software release
cycle commitment**

Faster product launch on hybrid network via
quick PNF onboarding through E2E Automation and
Standardization

NetOps – Agile delivery of network
Network team to automatically push equipment
models to OSS

Common standards to be used for PNF and VNF

... and Contributions

1

A reference implementation for automated PNF onboarding, for both SID as well as non-SID compliant OSS applications. Solution can be extended as a P&B lab for quick intro of the products & services

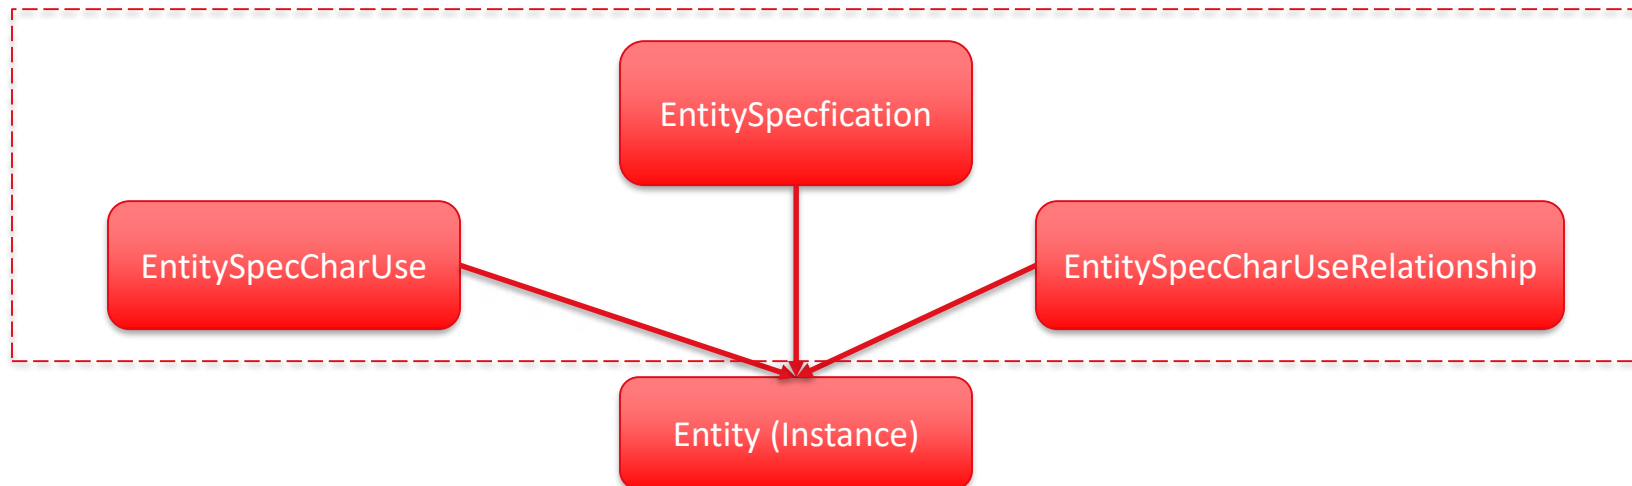

2

A Set of SID compliant Model extracted out of PNF YANG Schema, that could be released to the community as best practice toolkit for PNF onboarding

TMF OpenAPI CREATE PHYSICAL RESOURCE SPEC is used for creating meta-data for a SID compliant data model. The YANG file gets parsed and the information from the YANG file is primed into the SID compliant meta-data.

Implementation:

- **EquipmentSpec** – Uses name,@type attributes of the API to build the specifications
- **EquipmentPositionsOccupiedCompatibility** and **EquipmentMountingPositionCompatibility** - Uses **resourceSpecCharacteristic** and **resourceSpecRelationship** to build the compatibility matrix for the meta-data

BT has already kicked off work on the concept of Next Generation Plan and Build Platform with their strategic supplier Infosys leveraging YANG model for physical equipment and create NetOps catalog to reduce the P&B process time and looking to launch first phase by Dec 2018.

POC will be taken into full-fledged project to deliver –

- Equipment Modeling, meta-data creation in OSS systems (Use cases – 1a, 1b, 1c) – covered in slide number 12 leveraging YANG for device metamodeling
- Equipment Life Cycle creation/management – considering TOSCA to define and implement equipment interfaces
- Infrastructure service creation - considering TOSCA to handle Infrastructure service topology creation

NG P&B solution will finally integrate to Next Generation inventory management system, a BT OSS program in progress to simplify and aggregate the operations support systems (OSS) Inventory management stack for better visibility into systems and data, faster time-to-market, and agility to implement next-generation network technologies.

Thank You
